

Skill-taxonomy representation is a nuisance variable, not a new semantic capability

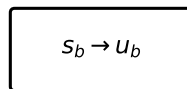

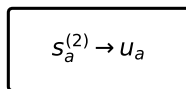

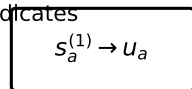

Frozen semantic basis (unchanged)

Taxonomy T

same u and support predicates

Semantics-preserving reparameterization $\phi(T)$

uniform package control: $p = (1/2, 1/2)$

primitive mass: $m(u_a) = 1/2, m(u_b) = 1/2$

same primitive support; one extra package identity

uniform package control: $m(u_a) = 2/3, m(u_b) = 1/3$

STRIP principle: semantic control should not change solely because package representation changed

STRIP-Cert: audit frozen support geometry

with $R^*(A) \setminus R^* = 1$: equalizable; $R^* > 1$: irreducible residual
